

SQL is an acronym of Structured Query Language. It is a standard language developed and used for accessing and modifying relational databases.

The SQL language was originally developed at the IBM research laboratory in San José, in connection with a project developing a prototype for a relational database management system called System R in the early 70s.

SQL is being used by many database management systems. Some of them are:

- > MySQL
- PostgreSQL
- ➢ Oracle
- ≻ SQLite

fppt.o

Microsoft SQL Server

-

Advantages of using SQL

fppt.

-

- Interactive Language-This language can be used for communicating with the databases and receive answers to the complex questions in seconds.
- Multiple data views-The users can make different views of database structure and databases for the different users.
- Portability-SQL can be used in the program in PCs, servers, laptops, and even some of the mobile phones and even on different dbms softwares
- No coding needed-It is very easy to manage the database systems without any need to write the substantial amount of code by using the standard SQL.
- Well defined standards-Long established are used by the SQL databases that is being used by ISO and ANSI. There are no standards adhered by the non-SQL databases.

SQL

fppt.

MySQL is currently the most popular open source database software. It is a multi-user, multithreaded database management system. MySQL is especially popular on the web. It is one of the parts of the very popular LAMP platform. Linux, Apache, MySQL and PHP or WIMP platform Windows, Apache, MySQL and PHP. MySQL AB was founded by Michael Widenius (Monty), David Axmark and Allan Larsson in Sweden in year 1995.

MySQL Features

- Open Source & Free of Cost:
- It is Open Source and available at free of cost.
- **Portability**:
- Small enough in size to instal and run it on any types of Hardware and OS like Linux, MS Windows or Mac etc.
- Security :
- Its Databases are secured & protected with password.
- Connectivity
- Various APIs are developed to connect it with many programming
- languages.

fppt.o

- Query Language
- It supports SQL (Structured Query Language) for handling database.

Types of SQL Commands

fppt.

-

DDL (Data Definition Language) To create database and table structure-commands like CREATE , ALTER , DROP etc. DML (Data Manipulation Language) Record/rows related operations.commands like SELECT..., INSERT..., DELETE..., UPDATE.... etc. DCL (Data Control Language) used to manipulate permissions or access rights to the tables. commands like GRANT, REVOKE etc. Transactional control Language. Used to control the transactions.commands like COMMIT, ROLLBACK, SAVEPOINT etc.

Numeric Data Types:

Data type in MySQL

-

- **INTEGER or INT** up to 11 digit number without decimal.
- SMALLINT up to 5 digit number without decimal.
- FLOAT (M,D) or DECIMAL(M,D) or NUMERIC(M,D)
 - Stores Real numbers upto **M** digit length (including .) with **D** decimal places.

e.g. Float (10,2) can store 1234567.89

- Date & Time Data Types:
 - **DATE** Stores date in YYYY-MM-DD format.
 - **TIME** Stores time in HH:MM:SS format.
- String or Text Data Type:
 - CHAR(Size)

fppt.c

A fixed length string up to 255 characters. (default is 1)

VARCHAR(Size)

A variable length string up to 255 characters.

Char, **Varchar**, **Date** and **Time** values should be enclosed with single (``) or double ("") quotes in MySQL. varchar is used in MySQL and varchar2 is used in Oracle.

Getting listings of available databases mysql> SHOW DATABASES;

_

- Creating a database-
- mysql> CREATE database myschool;
- Deleting a database mysql> DROP database <databasename>;
- to remove table mysql> drop table <tablename>;
- After database creation we can open the database using USE command mysql> USE myschool;
- To show list of tables in opened database
- mysql> SHOW TABLES;
- Creating a table in the database is achieved with CREATE table statement.
- mysql> CREATE TABLE student (lastname varchar(15), firstname varchar(15), city varchar(20), class char(2));
- The command DESCRIBE is used to view the structure of a table.
- mysql> DESCRIBE student;

fppt.c

To insert new rows into an existing table use the INSERT command: mysql>INSERT INTO student values('dwivedi','freya','Udaipur','4');

We can insert record with specific column only

mysql>INSERT INTO student(lastname,firstname,city) values('dwivedi','Mohak','Udaipur',); With the SELECT command we can retrieve previously inserted rows: <u>A general form of SELECT is:</u>

SELECT what to select(field name) FROM table(s) WHERE condition that the data must satisfy;

- Comparison operators are: < ; <= ; = ; != or <> ; >= ; >
- Logical operators are: AND ; OR ; NOT

fppt.o

 Comparison operator for special value NULL: IS mysql> SELECT * FROM student;

Database Commands in MySql

fppt.

Selecting rows by using the WHERE clause in the SELECT command mysql> SELECT * FROM student WHERE class="4"; Selecting specific columns(Projection) by listing their names mysql> SELECT first name, class FROM student; Selecting rows with null values in specific column mysql> SELECT * FROM Student WHERE City IS NULL ; BETWEEN- to access data in specified range mysql> SELECT * FROM Student WHERE class between 4 and 6; IN- operator allows us to easily test if the expression in the list of values. mysql> SELECT * FROM Student WHERE class in (4,5,6);

- Pattern Matching LIKE Operator
- A string pattern can be used in SQL using the following wild card
- □ % Represents a substring in any length
- Represents a single character
 Example:
- 'A%' represents any string starting with 'A' character.
- '___A' represents any 3 character string ending with 'A'.
- '_B%' represents any string having second character 'B'
- '___' represents any 3 letter string.

fppt.c

- A pattern is case sensitive and can be used with LIKE operator.
- mysql> SELECT * FROM Student WHERE Name LIKE 'A%';
- mysql> SELECT * FROM Student WHERE Name LIKE '%Singh%';
- mysql> SELECT Name, City FROM Student WHERE Class>=8 AND Name LIKE '%Kumar%';

<u>Database Commands in MySql</u> mysql> SELECT * FROM Student ORDER BY class; To get descending order use DESC key word. mysql> SELECT * FROM Student ORDER BY class DESC;

To display data after removal of duplicate values from specific column. mysql> select distinct class from student;

Deleting selected rows from a table using the DELETE command mysql> DELETE FROM student WHERE firstname="amar";

To modify or update entries in the table use the UPDATE command mysql> UPDATE student SET class="V" WHERE firstname="freya";

SQL

Database Commands in MySql

Creating Table with Constraints

The following constraints are commonly used in SQL:

NOT NULL -It Ensures that a column cannot have a NULL value

UNIQUE - It Ensures that all values in a column are different

PRIMARY KEY - A combination of a NOT NULL and UNIQUE. Uniquely identifies each row in a table

FOREIGN KEY - It Uniquely identifies a row/record in another table

CHECK - It Ensures that all values in a column satisfies a specific condition

DEFAULT - It Sets a default value for a column when no value is specified INDEX - It is Used to create and retrieve data from the database very quickly

SQL

Database Commands in MySql Creating Table with Constraints mysql> CREATE TABLE Persons (ID int NOT NULL PRIMARY KEY, LastName varchar(255) NOT NULL, FirstName varchar(255), Age int, City varchar(255) DEFAULT 'Jaipur', CONSTRAINT CHK_Person CHECK (Age>=18)); mysql> CREATE TABLE Orders (OrderID int NOT NULL, OrderNumber int NOT NULL, PersonID int, PRIMARY KEY (OrderID), FOREIGN KEY (PersonID) REFERENCES Persons(ID) ;

fppt.o

-

Altering Table

fppt.c

The SQL ALTER TABLE command is used to add, delete or modify columns in an existing table. You should also use the ALTER TABLE command to add and drop various constraints on an existing table. Syntax

The basic syntax of an ALTER TABLE command to add a New Column in an existing table is as follows.

ALTER TABLE table_name ADD column_name datatype;

The basic syntax of an ALTER TABLE command to DROP COLUMN in an existing table is as follows.

ALTER TABLE table_name DROP COLUMN column_name;

The basic syntax of an ALTER TABLE command to change the DATA TYPE of a column in a table is as follows.

ALTER TABLE table_name MODIFY COLUMN column_name datatype;

Altering Table

fppt.o

The basic syntax of an ALTER TABLE command to add a NOT NULL constraint to a column in a table is as follows. ALTER TABLE table name MODIFY column name datatype NOT NULL; The basic syntax of ALTER TABLE to ADD UNIQUE CONSTRAINT to a table is as follows. ALTER TABLE table name ADD CONSTRAINT MyUniqueConstraint UNIQUE(column1, column2...); The basic syntax of an ALTER TABLE command to ADD CHECK CONSTRAINT to a table is as follows. ALTER TABLE table name ADD CONSTRAINT MyUniqueConstraint CHECK (CONDITION); The basic syntax of an ALTER TABLE command to ADD PRIMARY KEY constraint to a table is as follows. ALTER TABLE table name ADD CONSTRAINT MyPrimaryKey PRIMARY KEY (column1, column2...); The basic syntax of an ALTER TABLE command to DROP CONSTRAINT from a table is as follows. ALTER TABLE table name DROP CONSTRAINT MyUniqueConstraint;

Altering Table

ALTER TABLE table_name DROP INDEX MyUniqueConstraint; The basic syntax of an ALTER TABLE command to DROP PRIMARY KEY constraint from a table is as follows.

ALTER TABLE table_name DROP CONSTRAINT MyPrimaryKey; If we are using MySQL, the code is as follows –

ALTER TABLE table_name DROP PRIMARY KEY;

fppt.o

MySQL Order By clause is used to sort the table data in either Ascending order or Descending order. By default, data is not inserted into Tables in any order unless we have an index.

So, If we want to retrieve the data in any particular order, we have to sort it by using MySQL Order By statement.

- Syntax:-SELECT Column_Names
- FROM Table_Name

fppt.

ORDER BY {Column1}[ASC | DESC] {Column2}[ASC | DESC]

MySQL Order by– e.g.

fppt.

Suppose we are having student table with following data.

nysql> select * from student;											
rollno	name	class	marks								
1 2 3 4 5	freya mohak vishal vimal anil	10 1 10 10 2	88 99 84 82 82								

Now we write the query – select * from student order by class;

μ	ysql> se	lect × fr	•o m	stude	nt	order	by	class;
	rollno	name	ļ	class		marks		
	2 5 1	mohak anil freya		1 2 10		99 82 88		
	3 4	vishal vimal		10 10		84 82		

Query result will be in ascending order of class. If we not specify asc/desc in query then ascending clause is applied by default

MySQL Order by– e.g.

fppt.o

Suppose we are having student table with following data.

mysql> select * from student;											
rollno	name	class	marks								
1	freya	. 10	88								
2	l mohak		: 99 i								
3	l vishal	. 10	84 1								
4	l vimal	- 10	82 8								
5	l anil	: 2	: 82 :								

Now we write the query – select * from student order by class desc;

ysql> se	lect * fr	n stude	; order	by	class	desc;
rollno	name	class	marks			
1	; ; freya	10	88			
i 3	¦ visĥal	10	84			
4	¦ vimal	10	82			
5	¦ anil	2	82			
2	i mohak	1	99			

Query result will be in descending order of class

MySQL Order by – e.g.

fppt.

Suppose we are having student table with following data.

nysql> select * from student;											
rollno	name	class	marks								
1 2 3 4 5	freya mohak vishal vimal anil	10 1 10 10 2	88 99 84 82 82								

Now we write query-select * from student order by class asc, marks asc;

m.	ysql> se	;1	ect * fr		n studer	11	t order	_ Ե	/ class	asc,marks	asc;
İ	rollno	į	name	ł	class		marks				
ł	2		mohak	-	1		99	╏			
H	5		anil		2		82				
H	4		vimal		10		82				
Н	3		vishal		10		84				
Н	1		freya		10		88				
		_									

Query result will be ascending order of class and if same class exists then ordering will done on marks column(ascending order)

MySQL Order by– e.g.

fppt.

Suppose we are having student table with following data.

ų.	<pre>nysql> select * from student;</pre>											
	rollno	name		class		marks						
	 1 2	freya mohak		 10 1		88 99						
	3	vishal		19		84						
	4 5	; vimal ! anil		10 2		82 : 82 :						
					-							

Now we write query-select * from student order by class asc, marks desc;

	ysql> se	1	ect * fr) M	stude		t order	.by	class	asc,marks	desc;
	rollno	ł	name		class	I	marks				
	2	ł	mohak		1	ł	99	ł			
E	5		anil		2		82				
E	1		freya		10		88				
E	3		visĥal		10		84				
E	4		vimal		10		82				
				+-		+		+			

Query result will be ascending order of class and if same class exists then ordering will done on marks column(descending order)

An aggregate function performs a calculation on multiple values and returns a single value. For example, you can use the AVG() aggregate function that takes multiple numbers and returns the average value of the numbers.Following is the list of aggregate functions supported by mysql.

Name	Purpose
SUM()	Returns the sum of given column.
MIN()	Returns the minimum value in the given column.
MAX()	Returns the maximum value in the given column.
AVG()	Returns the Average value of the given column.
COUNT()	Returns the total number of values/ records as per given column.

Consider a lable Emp having following records as-

Null values are excluded while (avg)aggregate function is used

Emp									
Code	Name	Sal							
E1	Mohak	NULL							
E2	Anuj	4500							
E3	Vijay	NULL							
E4	Vishal	3500							
E5	Anil	4000							

SQL Queries

fppt.o

mysql> Select Sum(Sal) from EMP; mysql> Select Min(Sal) from EMP; mysql> Select Max(Sal) from EMP; mysql> Select Count(Sal) from EMP; mysql> Select Avg(Sal) from EMP; mysql> Select Count(*) from EMP;

The GROUP BY clause groups a set of rows/records into a set of summary rows/records by values of columns or expressions. It returns one row for each group.

We often use the GROUP BY clause with aggregate functions such as SUM, AVG, MAX, MIN, and COUNT. The aggregate function that appears in the SELECT clause provides information about each group.

The GROUP BY clause is an optional clause of the SELECT statement.

Syntax –

fppt.

SELECT 1, c2,..., cn, aggregate_function(ci)

FROM table WHERE where conditions GROUP BY c1, c2,...,cn; Here c1,c2,ci,cn are column name

MySQL group by – e.g.

fppt.

Suppose we are having student table with following data.

nysql> select * from student;												
rollna		name	class	mark	s i							
		freya mohak	10	8	8							
		vishal vimal anil	14 10 2	8	4 2 2							

Now we write query-select class from student group by class;

mysql>	select	class	from	student	group	by	class;
+	+						
¦ clas	s i						
+	+						
1	1						
1	2						
1	0						
+							

Query result will be unique occurrences of class values, just similar to use distinct clause like (select distinct class from student).

MySQL GROUP BY with aggregate functions

The aggregate functions allow us to perform the calculation of a set of rows and return a single value. The GROUP BY clause is often used with an aggregate function to perform calculation and return a single value for each subgroup.

For example, if we want to know the number of student in each class, you can use the COUNT function with the GROUP BY clause as follows:Suppose we are having student table

with following data.

fppt.o

mysql> se.	Lect * fro	om studer	
rollno	name	class	marks
i	freya	10	88
i 2	i mohak		:
3	l vishal	10	84
: 4	l vimal	10	82 :
: 5	: anil	2	82 :
			_

Now we write query-select class,count(*) from student group by class;

mу	sql> s	el	ect cla	ss,	count(*)	from	student	group	by	class;
-	class	-	count(*	>	-					
+- 	1	+-		+ L	-					
	2 10			L }						
+-		-+								

Query result will be unique occurrences of class values along with counting of students(records) of each class(sub group).

MySQL GROUP BY with aggregate functions

we are having student table with following data.

IJ	ysql> se	lect * f	ror	ı stude	t;
	rollno	i name		class	marks
	1 2 3 4 5	freya mohak vishal vimal anil		10 10 10 10 2	88 99 84 82 82

Now we write query-select class,avg(marks) from student group by class;

mysql>	select	class,au	g(marks)	from	student	group	by class;	
class	i avg	(marks)						
+1 1 2 10		99.0000 82.0000 84.6667						

Query result will be unique occurrences of class values along with average marks of each class(sub group).

SQL

MySQL GROUP BY with aggregate functions (with where and order by clause) we are having student table with following data.

	<u> </u>				
mys	ql> se	lect * from from from from from from from from	om stude	nt;	
i r	ollno	name	class	marks	
	1 2	freya mohak	10 1	88 99	
	34	¦ vishal ¦ vimal	: 10 : 10	84 82	
	5	l anil	2	82	

Now we write query—select class,avg(marks) from student where class<10 group by class order by marks desc;

Query result will be unique occurrences of class values where class<10 along with average marks of each class(sub group) and descending ofer of marks.

SQL

fppt.

The HAVING clause is used in the SELECT statement to specify filter conditions for a group of rows or aggregates. The HAVING clause is often used with the GROUP BY clause to filter groups based on a specified condition. To filter the groups returned by GROUP BY clause, we use a HAVING clause. WHERE is applied before GROUP BY, HAVING

is applied after (and can filter on aggregates).

MySQL GROUP BY with aggregate functions & having clause

we are having student table with following data.

J	ysql> se	1.	ect * from from from from from from from from	n stude	t;	
	rollno		name	class	marks	
	1 2		freya mohak	10	88	
	3		vishal	10	84	
	4		vimal	10	82 :	
	5		anil	2	82	

Now we write query—select class,avg(marks) from student group by class having avg(marks)<90;

mysql≻ s	elect class,avg(marks) from stu	udent group by class having avg(marks)<90;
+	-++	
class	avg(marks)	
+	-++	
i z		
10	84.6667	
+2 10	++ 82.0000 84.6667	

Query result will be unique occurrences of class values along with average marks of each class(sub group) and each class having average marks<90.

MySQL GROUP BY with aggregate functions & having clause

we are having student table with following data.

mysql>	5 C	:] (ect * fr	n stude	t;	_
; roll	no		name	class	marks	
			freya	10	88	
	2		mohak	1	99	
	3		vishal	10	84	
	-4		vimal	10	82	
	5		anil	2	82	

Now we write query—select class,avg(marks) from student group by class having count(*)<3;

mysq	l> se	elect class,a	vg(marks)	from	student	group	by	class	having	count(*)<3;
l cl	ass	avg(marks)								
+ 	1	99.0000	-+ 							
¦ ₊	2	82.0000	+ +							

Query result will be unique occurrences of class values along with average marks of each class(sub group) and each class having less than 3 rows.

Cartesian product (X)/cross joint

Cartesian Product is denoted by X symbol. Lets say we have two relations R1 and R2 then the cartesian product of these two relations (R1 X R2) would combine each tuple of first relation R1 with the each tuple of second relation R2.

Cartesian product (X) example Table a and Table b as shown below

mysql≻ se]	lect * from a;
l Name	val
vishal ram	11 22
2 rows in	set (0.00 sec)
mysql> sel	lect * from b;
name +	-+
¦ ram vikrant +	-
2 rows in	set (0.00 sec)

fppt.

Mysql query -

Select * from a,b;

Select * from a cross join b;

mysql> s +	elect * f -+	rom a,b;
l Name	val	name l
¦ visha] ¦ ram ¦ visha] ¦ ram	11 22 11 22 22	ram ram vikrant vikrant
4 rows i	n set (Ø.	.00 sec)

Degree of cartesion product is 3 and cardinality is 4=(2 rows of a X 2 rows of b)

Join – Join is used to fetch data from two or more tables, which is joined to appear as single set of data. It is used for combining column from two or more tables by using values common to both tables.

Types of JOIN

Following are the types of JOIN that we can use in SQL:

- Inner
- Outer
- Left
- Right

INNER Join or EQUI Join ⋈

This is a simple JOIN in which the result is based on matched data as per the equality condition specified in the SQL query.

SQL

INNER Join or EQUI Join example Table a and Table b as shown below

mysql> se	lect * from a;
Name	val
vishal ram	11 22
2 rows in	set (0.00 sec)
mysql> se	lect * from b; -+
name +	- +
¦ ram ¦ vikrant	-+
2 rows in	set (0.00 sec)

fppt.o

Mysql query -

Select course.student_name from couse , student where course.student_name=student.stude nt_name;

Select a.name from a inner join b where a.name=b.name;

nysql≻	select	a.name	from	a	inner	join	h	where	a.name=b.	.name;
+	-+									
l name	ł									
+	-+									
l ram	ł									
+	-+									

Natural JOIN(⋈)

Natural Join is a type of Inner join which is based on column having same name and same datatype present in both the tables to be joined.E.g.

Select * from a natural join b;

LEFT Outer Join D

-

The left outer join returns a resultset table with the matched data from the two tables and then the remaining rows of the left table and null from the right table's columns. E g

mysql> se:	lect ×	from a;			
Name	val				
l vishal ram	11 22				
2 rows in	set <	0.00 sec>			
mysql≻ se	lect *	from b;			
name +	-+				
¦ ram vikrant +	-+				
2 rows in	set (0.00 sec)			

fppt.o

Mysql query -

Select * from a left outer join b on (a.name=b.name);

mysql> se	lect * :	from a left	outer ,	join b on	(a.name=b.name);
Name	l val	name i			
¦ vishal ¦ ram	+ 11 22	NULL ram			
2 rows in	set (0	.02 sec)			

RIGHT Outer Join

The right outer join returns a resultset table with the matched data from the two tables being joined, then the remaining rows of the right table and null for the remaining left table's columns.E.g.

mysql> select * from a;						
Name	val					
vishal ram	11 22					
2 rows in	set (0.	.00 sec)				
mysql> se] +	lect * f -+	rom b;				
name +	: -+					
¦ ram ¦ vikrant +	-+					
2 rows in	set (Ø.	.00 sec)				

fppt.o

Mysql query -

Select * from a right outer join b on (a.name=b.name);

ny:	sql≻	select	* from a ri	ght outer	join b on	(a.name=b.name);
	Name	val	i name i			
	ram NULL	22 NULL	ram vikrant			
2	rows	in set	(0.00 sec)			

Full Outer Joi

fppt.c

M

The full outer join returns a resultset table with the matched data of two table then remaining rows of both left table and then the right table.E.g.

mysql> sel	ect *	from	a;
Name	val		
vishal ram	11 22		
2 rows in	set (9.00 s	sec>
mysql> sel +	ect *	from	ь;
name +	-+-		
¦ ram vikrant			
2 rows in	set (0.00	sec)

Mysql query –

Select * from a left outer join b on (a.name=b.name) union Select * from right outer join b а on (a.name=b.name);
