## Number System

In general term computer represent information in different types of data forms i.e. number , character ,picture , audio , video etc.
Computers are made of a series of switches/ gates. Each switch has two states: ON(1) or OFF(0).That's why computer works on the basis of binary number system(0/1).But for different purpose different number systems are used in computer world to represent information. E.g. Octal, Decimal, Hexadecimal.

| NUMBER SYSTEM |  |  |
| :--- | :---: | :--- |
| SYSTEM | BASE | DIGIT |
| Binary | 2 | 01 |
| Octal | 8 | 01234567 |
| Decimal | 10 | 0123456789 |
| Hexadecimal | 16 | 0123456789 A B C D E F |

Visit : python.mykvs.in for regular updates

## Decimal Number System

Characteristics

- Ten symbols
- 0 1 2 3 4 5 6 7 8 9

Positional

- 2945

(Most) people use the decimal number system Why?
THIS A POSITIONAL NUMBER SYSTEM .and that's of great advantage ..simple shifting the position of decimal.It become complexeither
case to use number system <10 or >10.

## Binary Number System

## Characteristics

- TWO symbols
- 01

Positional

- Positional
- $1010^{2}$ 玉 $1100_{2}$

Most (digital) computers use the binary number system Why?
Computers are made of a series of switches/ gates. Each switch has two states:
ON(1) or OFF(0).That's why computer works on the basis of binary number system(0/1).

## Decimal-Binary Equivalence

| Decinnal Binary |  | Decinnal Binary |  |
| :---: | :---: | :---: | :---: |
| 0 | (0) | 16 | 10000 |
| 1 | 1 | 17 | 100011 |
| 2 | 10 | 18 | 10010 |
| 3 | 11 | 19 | 10011 |
| 4 | 100 | 20 | 10100 |
| 5 | 101 | 21 | 10101 |
| 6 | 110 | 22 | 10110 |
| 7 | 1111 | 23 | 101111 |
| 8 | 1000 | 24 | 11000 |
| 9 | 1001 | 25 | 12001 |
| 10 | 1010 | 26 | 11010 |
| 111 | 10111 | 27 | 11011 |
| 12 | 1100 | 28 | 11100 |
| 13 | 1101 | 29 | 1110101 |
| 14 | 1110 | 30 | 11110 |
| 15 | 11111 | 31 | 111111 |

## Binary - Decimal Conversion

## Using positional notation

$100101_{2}=\left(1^{*} 2^{5}\right)+\left(0^{*} 2^{4}\right)+\left(0^{*} 2^{3}\right)+\left(1^{*} 2^{2}\right)+\left(0^{*} 2^{1}\right)+\left(1^{*} 2^{0}\right)$
$=32+0+0+4+0+1$
$=37$

## Decimal-Binary Conversion

Using the Division Method:
Divide decimal number by 2 until you reach zero, and then collect the remainders in reverse. $\quad 22_{10}=10110_{2}$

$$
\begin{aligned}
& 2 \\
& 2 \\
& 2 \\
& 2 \\
& 22 \\
& 2 \\
& 2 \\
& 2 \\
& 2 \\
& 2 \\
& 2 \\
& 2 \\
& \hline
\end{aligned} \frac{1}{2} \quad \begin{aligned}
& \text { Rem: } \\
& \\
& \\
& 0
\end{aligned}
$$

## Hexadecimal Number System

## Characteristics

- Sixiteen symbols
- 0 1 2 3 4 5 6 789 A B CDEF

Positional
$A_{13} D_{16}$ 3DA1 $_{16}$
Computer programmers often use the hexadecimal number system,Why?
Computers only work on the binary number system. The hexadecimal number system is commonly used to describe locations in computer memory. They are also used in assembly language instructions.

## Decimal-Hexadecimal Equivalence

| Decimal Hex |  | Decimal | Hex | Decimal | Hex |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 16 | 10 | 32 | 20 |
| 1 |  | 17 | 11 | 33 | 21 |
| 2 |  | 18 | 12 | 34 | 22 |
| 3 |  | 19 | 13 | 35 | 23 |
| 4 | 4 | 20 | 14 | 36 | 24 |
| 5 | 5 | 21 | 15 | 37 | 25 |
| 6 | 6 | 22 | 16 | 38 | 26 |
| 7 | 7 | 23 | 17 | 39 | 27 |
| 8 | 8 | 24 | 18 | 40 | 28 |
| 9 | 9 | 25 | 19 | 41 | 29 |
| 10 | A | 26 | 1A | 42 | 2A |
| 11 | B | 27 | 1B | 43 | 2B |
| 12 | C | 28 | 1 C | 44 | 2C |
| 13 | D | 29 | 1D | 45 | 2D |
| 14 | E | 30 | 1E | 46 | 2E |
| 15 | F | 31 | 1 F | 47 | 2F |

Visit : python.mykvs.in for regular updates

## Hexadecimal to decimal

$$
\begin{aligned}
25_{16} & =\left(2 * 16^{1}\right)+\left(5^{*}{ }^{*} 16^{0}\right) \\
& =32+5 \\
& =37
\end{aligned}
$$

Decimal to hexadecimal

$$
\begin{array}{r}
37 / 16=2 R 5 \\
2 / 16=0 R 2
\end{array}
$$

Read from bottom to top: $\mathbf{2 5}_{16}$

## Binary - hexadecimal

| Four-bit Group | Decimal Digit |
| :--- | :---: |
| 0000 | 0 |
| 0001 | 1 |
| 0010 | 2 |
| 0011 | 3 |
| 0100 | 4 |
| 0101 | 5 |
| 0110 | 6 |
| 0111 | 7 |
| 1000 | 8 |
| 1001 | 9 |
| 1010 | 10 |
| 1011 | 11 |
| 1100 | 12 |
| 1101 | 13 |
| 1110 | 14 |
| 1111 | 15 |

| Hexadecimal Digit |
| :--- |
| $\mathbf{0}$ |
| $\mathbf{1}$ |
| $\mathbf{2}$ |
| $\mathbf{3}$ |
| $\mathbf{4}$ |
| $\mathbf{5}$ |
| $\mathbf{6}$ |
| $\mathbf{7}$ |
| $\mathbf{8}$ |
| $\mathbf{9}$ |
| A |
| B |
| C |
| D |
| E |
| F |

## Binary to hexadecimal

Convert $110100110_{2}$ to hex
Starting at the right end, split into groups of 4:

$$
\begin{aligned}
110100110 & \Rightarrow \\
0110 & =6 \\
1010 & =A \\
0001 & =1 \quad(\text { pad empty digits with } 0)
\end{aligned}
$$

$$
110100110_{2}=1_{1} \mathbb{A}_{16}
$$

## Hexadecimal to Binary

Convert 3D9 ${ }_{16}$ to binary Convert each hex digit to 4 bits:

$$
\begin{aligned}
& 3=0011 \\
& D=1101 \\
& 9=1001 \\
& 00111_{101} 1001 \text { 葍 } \\
& 3 D 9_{16}=11110100_{12} \text { (can remove }
\end{aligned}
$$

leading zeros)

## Octal Number System

## Characteristics

- Eight symbols
-01234567
Positional
-17438 731488
Computer programmers often use the octal number system,Why?
Octal and hex use the human advantage that they can work with lots of symbols while it is still easily convertible back and forth between binary.

## Decimal-Octal Equivalence

| Decimal | Octal | Decimal | Octal | Decimal | Octal |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 16 | 20 | 32 | 40 |
| 1 | 1 | 17 | 21 | 33 | 41 |
| 2 | 2 | 18 | 22 | 34 | 42 |
| 3 | 3 | 19 | 23 | 35 | 43 |
| 4 | 4 | 20 | 24 | 36 | 44 |
| 5 | 5 | 21 | 25 | 37 | 45 |
| 6 | 6 | 22 | 26 | 38 | 46 |
| 7 | 7 | 23 | 27 | 39 | 47 |
| 8 | 10 | 24 | 30 | 40 | 50 |
| 9 | 11 | 25 | 31 | 41 | 51 |
| 10 | 12 | 26 | 32 | 42 | 52 |
| 11 | 13 | 27 | 33 | 43 | 53 |
| 12 | 14 | 28 | 34 | 44 | 54 |
| 13 | 15 | 29 | 35 | 45 | 55 |
| 14 | 16 | 30 | 36 | 46 | 56 |
| 15 | 17 | 31 | 37 | 47 | 57 |

Visit : python.mykvs.in for regular updates

## Octal to decimal

$$
357_{8}
$$

positional powers of 8 :

decimal positional value: 64
 $\square$

Octal number:

$$
357
$$

$$
\begin{aligned}
& (3 \times 64)+(5 \times 8)+(7 \times 1) \\
& =192+40+7=239_{10}
\end{aligned}
$$

Visit : python.mykvs.in for regular updates

## Decimal to octal

## Using the Division Method:

Example 1:

$$
214_{10}=326_{8}
$$

$$
\begin{array}{ccc}
8 \text { 8) } 214 & \text { Rem: } \\
8 \text { ) } 26 & 6 \\
8) & 3 & 2 \\
& 0 & 3
\end{array}
$$

## Binary-Octal Conversion

E.g.

$$
\begin{aligned}
& 001010000100111101_{2} \\
& 12044758
\end{aligned}
$$

Octal to binary

$$
\begin{aligned}
& 1204758 \\
& 001010000100111101_{2}
\end{aligned}
$$

## Encoding Schemes/ String representation

String is any finite sequence of characters.Any string includes etters, numerals, symbols and punctuation marks.

Computers are designed to work internally with numbers. In order to handle characters, we need to choose a number for each character. There are many ways to do this which are knows as encoding schemes.

Visit : python.mykvs.in for regular updates

## Encoding schemes

Following are some Encoding schemes

- ASCII
- UNICODE
- ISCII

## Encoding Scheme

## ASCII

It is most common coding system (Pronounced ass-key).
ASCII = American National $\underline{S} t a n d a r d$ Code for Information Interchange
It is Defined in ANSI document X3.4-1977. It is a 7-bit code.Its 8th bit is unused (or used for a parity bit)

$$
2^{7}=128 \text { codes }
$$

Two general types of codes:

> 95 are "Graphic" codes (displayable on a console)
> 33 are "Control" codes (control features of the conso communicationschannel)

Visit : python.mykvs.in for regular updates

## Encoding Scheme

## ASCII

|  | 000 | 001 | 010 | 011 | 100 | 101 | 110 | 111 |

## LEAST SIGNIFICANT BIT

Visit : python.mykvs.in for regular updates

## Encoding Scheme

ASCII

## "Hello, world" Example

|  | Binary | Hexadecimal |  | Decimal |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{H}=01001000$ | $=$ | 48 | $=$ | 72 |
| $\mathrm{e}=01100101=$ | 65 | $=$ | 101 |  |
| $\mathrm{l}=01101100=$ | 6 C | $=$ | 108 |  |
| $\mathrm{l}=01101100=$ | 6 C | $=$ | 108 |  |
| $\mathrm{o}=01101111=$ | 6 F | $=$ | 111 |  |
| ,$=00101100=$ | 2 C | $=$ | 44 |  |
| $=00100000=$ | 20 | $=$ | 32 |  |
| $\mathrm{w}=01110111=$ | 77 | $=$ | 119 |  |
| $\mathrm{o}=01100111=$ | 67 | $=$ | 103 |  |
| $\mathrm{r}=01110010=$ | 72 | $=$ | 114 |  |
| $\mathrm{l}=01101100=$ | 6 C | $=$ | 108 |  |
| $\mathrm{~d}=01100100$ | $=$ | 64 | $=$ | 100 |

## Encoding Scheme

## UNICODE

It is a worldwide character-encoding standard .Its main objective is to enable a single, unique character set that is capable of supporting all characters from all scripts, as well as symbols, that are commonly utilized for computer processing throughout the world.

## Encoding Scheme

## VARIOUS UNICODE ENCODING

| Name | UTF-8 | UTF-16 | UTF-32 |
| :--- | :--- | :--- | :--- | :--- |
| Smallest code point | 0000 | 0000 | 0000 |
| Largest code point | 10FFFF | 10FFFF | 10FFFF |
| Code unit size | 8 bits | 16 bits | 32 bits |
| Byte order | N/A | <BOM> | <BOM> |
| Fewest bytes per <br> character | 1 | 2 | 4 |
| Most bytes per <br> character | 4 | 4 | 4 |

## Encoding Scheme

## UTF-8

It is most popular type of Unicode encoding. It uses one byte for standard English letters and symbols, two bytes for additional Latin and Middle Eastern characters, and three bytes for Asian characters.Any additional characters can be represented using four bytes.lt is backwards compatible with ASCII, since the first 128 characters are mapped to the same values.

## Encoding Scheme

## UTF-8 REPRESENTATION

| Repr esent ation | Representation format | Example |
| :---: | :---: | :---: |
| 1 Octet Repres entation |  |  |
| 2 Octet Repres entation |  |  |
| 3 Octet Repres entation | 1110xxxx 10xxxxxx 10xxxxxx $\qquad$ |  <br> Bold (as control bit) others are data bit |
| 4 Octet Repres entation | 11110x88 10x8x8x8 10xxxxx8 10x8xxxx | $\begin{array}{lll}\left.\text { Letter } x^{\prime}(10+4]\right] \\ 11110000 & 10000000 & 1000000110000001\end{array}$ |

Visit : python.mykvs.in for regular updates

## Encoding Scheme

## UTF－32

It is a multi－byte encoding that represents each character with 4 bytes
＊Makes it space inefficient
Its main use is in internal APIs where the data is single code points or glyphs，rather than strings of characters Used on Unix systems sometimes for storage of information

## Encoding Scheme

## UTF-32

It is a fixed length encoeding scheme that uses exactly 4 bytes to represent all Unicode code points.E.g.
Letter ' A ' $[\mathrm{U}+41$ ]

Visit : python.mykvs.in for regular updates

## Encoding Scheme

## ISCII

ISCII stands for Indian Script Code for Information Interchange for Indian languages．It is an 8－bits code to represent Indian scripts．
The Department of Electronics（DOE）has established standard and standard are in action from 1983.
These codes are used for 10 Indian scripts－Devanagri， Punjabi，Gujrati，Udia，Bengali，Asami，Telgu，Kannad， Malayalam and Tamil．C－DAC（established in August－ September，1988）developed standard for font coding in 1990 is called ISFOC（Indian Standards for Font Coding）．
