# Computer Science Class XII (As per CBSE Board)

Chapter 10
Structured Query Language

Visit : python.mykvs.in for regular updates

New

syllabus

2023-24

SQL is an acronym of Structured Query Language. It is a standard language developed and used for accessing and modifying relational databases.

The SQL language was originally developed at the IBM research laboratory in San José, in connection with a project developing a prototype for a relational database management system called System R in the early 70s.

SQL is being used by many database management systems. Some of them are:

- > MySQL
- PostgreSQL
- ➢ Oracle
- ➢ SQLite
- Microsoft SQL Server

## Advantages of using SQL

- Interactive Language-This language can be used for communicating with the databases and receive answers to the complex questions in seconds.
- Multiple data views-The users can make different views of database structure and databases for the different users.
- Portability-SQL can be used in the program in PCs, servers, laptops, and even some of the mobile phones and even on different dbms softwares
- No coding needed-It is very easy to manage the database systems without any need to write the substantial amount of code by using the standard SQL.
- Well defined standards-Long established are used by the SQL databases that is being used by ISO and ANSI. There are no standards adhered by the non-SQL databases.

MySQL is currently the most popular open source database software. It is a multi-user, multithreaded database management system. MySQL is especially popular on the web. It is one of the parts of the very popular LAMP platform. Linux, Apache, MySQL and PHP or WIMP platform Windows, Apache, MySQL and PHP. MySQL AB was founded by Michael Widenius (Monty), David Axmark and Allan Larsson in Sweden in year 1995.

- MySQL Features
- Open Source & Free of Cost:
- It is Open Source and available at free of cost.
- **Portability**:
- Small enough in size to instal and run it on any types of Hardware and OS like Linux, MS Windows or Mac etc.
- Security :
- Its Databases are secured & protected with password.
- Connectivity
- Various APIs are developed to connect it with many programming
- languages.
- Query Language
- It supports SQL (Structured Query Language) for handling database.

## Types of SQL Commands DDL (Data Definition Language) To create database and table structure-commands

like CREATE , ALTER , DROP etc.

## DML (Data Manipulation Language)

Record/rows related operations.commands like

SELECT...., INSERT..., DELETE..., UPDATE.... etc.

## DCL (Data Control Language)

used to manipulate permissions or access rights to the tables. commands like GRANT , REVOKE etc.

Transactional control Language.

Used to control the transactions.commands like COMMIT, ROLLBACK, SAVEPOINT etc.

## Data type in MySQL

- □ Numeric Data Types:
  - **INTEGER or INT** up to 11 digit number without decimal.
  - SMALLINT up to 5 digit number without decimal.

#### FLOAT (M,D) or DECIMAL(M,D) or NUMERIC(M,D)

Stores Real numbers upto **M** digit length (including .) with **D** decimal places.

e.g. Float (10,2) can store 1234567.89

- Date & Time Data Types:
  - **DATE** Stores date in YYYY-MM-DD format.
  - **TIME** Stores time in HH:MM:SS format.
- □ String or Text Data Type:
  - CHAR(Size)

A fixed length string up to 255 characters. (default is 1)

#### VARCHAR(Size)

A variable length string up to 255 characters.

**Char, Varchar, Date** and **Time** values should be enclosed with single (``) or double ( "") quotes in MySQL. varchar is used in MySQL and varchar2 is used in Oracle.

- Database Commands in MySql
- Getting listings of available databases
- mysql> SHOW DATABASES;
- Creating a database-
- mysql> CREATE database myschool;
- Deleting a database mysql> DROP database <databasename>;
- to remove table mysql> drop table <tablename>;
- After database creation we can open the database using USE command mysql> USE myschool;
- To show list of tables in opened database
- mysql> SHOW TABLES;
- Creating a table in the database is achieved with CREATE table statement. mysql> CREATE TABLE student (lastname varchar(15), firstname varchar(15), city varchar(20), class char(2));
- The command DESCRIBE is used to view the structure of a table.

mysal> DESCRIBE student;

To insert new rows into an existing table use the INSERT command: mysql>INSERT INTO student values('dwivedi','freya','Udaipur','4');

We can insert record with specific column only

mysql>INSERT INTO student(lastname,firstname,city) values('dwivedi','Mohak','Udaipur',); With the SELECT command we can retrieve previously inserted rows: <u>A general form of SELECT is:</u>

SELECT what to select(field name) FROM table(s) WHERE condition that the data must satisfy;

- Comparison operators are: < ; <= ; = ; != or <> ; >= ; >
- Logical operators are: AND ; OR ; NOT
- Comparison operator for special value NULL: IS mysql> SELECT \* FROM student;

Selecting rows by using the WHERE clause in the SELECT command mysql> SELECT \* FROM student WHERE class="4"; Selecting specific columns(Projection) by listing their names mysql> SELECT first\_name, class FROM student; Selecting rows with null values in specific column mysql> SELECT \* FROM Student WHERE City IS NULL ; BETWEEN- to access data in specified range mysql> SELECT \* FROM Student WHERE class between 4 and 6; IN- operator allows us to easily test if the expression in the list of values. mysql> SELECT \* FROM Student WHERE class in (4,5,6);

- Pattern Matching LIKE Operator
- A string pattern can be used in SQL using the following wild card
- □ % Represents a substring in any length
- Represents a single character
  Example:
- Example:
- 'A%' represents any string starting with 'A' character.
- '\_\_\_A' represents any 3 character string ending with 'A'.
- '\_B%' represents any string having second character 'B'
- '\_\_\_' represents any 3 letter string.
- A pattern is case sensitive and can be used with LIKE operator.
- mysql> SELECT \* FROM Student WHERE Name LIKE 'A%';
- mysql> SELECT \* FROM Student WHERE Name LIKE '%Singh%';

mysql> SELECT Name, City FROM Student WHERE Class>=8 AND Name

'%Kumar%';

<u>Database Commands in MySql</u> mysql> SELECT \* FROM Student ORDER BY class; To get descending order use DESC key word. mysql> SELECT \* FROM Student ORDER BY class DESC;

To display data after removal of duplicate values from specific column. mysql> select distinct class from student;

Deleting selected rows from a table using the DELETE command mysql> DELETE FROM student WHERE firstname="amar";

To modify or update entries in the table use the UPDATE command mysql> UPDATE student SET class="V" WHERE firstname="freya";

**Creating Table with Constraints** 

The following constraints are commonly used in SQL:

**NOT NULL** -It Ensures that a column cannot have a NULL value

**UNIQUE** - It Ensures that all values in a column are different

**PRIMARY KEY** - A combination of a NOT NULL and UNIQUE. Uniquely identifies each row in a table

FOREIGN KEY - It Uniquely identifies a row/record in another table CHECK - It Ensures that all values in a column satisfies a specific condition

DEFAULT - It Sets a default value for a column when no value is specified INDEX - It is Used to create and retrieve data from the database very quickly

SQL

Database Commands in MySql **Creating Table with Constraints** mysql> CREATE TABLE Persons ( ID int NOT NULL PRIMARY KEY, LastName varchar(255) NOT NULL, FirstName varchar(255), Age int, City varchar(255) DEFAULT 'Jaipur', CONSTRAINT CHK Person CHECK (Age>=18) ); mysql> CREATE TABLE Orders ( OrderID int NOT NULL, OrderNumber int NOT NULL, PersonID int, PRIMARY KEY (OrderID), **FOREIGN KEY (PersonID) REFERENCES** Persons(ID) ;;

Altering Table

The SQL ALTER TABLE command is used to add, delete or modify columns in an existing table. You should also use the ALTER TABLE command to add and drop various constraints on an existing table. Syntax

The basic syntax of an ALTER TABLE command to add a New Column in an existing table is as follows.

ALTER TABLE table\_name ADD column\_name datatype;

The basic syntax of an ALTER TABLE command to DROP COLUMN in an existing table is as follows.

ALTER TABLE table\_name DROP COLUMN column\_name;

The basic syntax of an ALTER TABLE command to change the DATA TYPE of a column in a table is as follows.

ALTER TABLE table\_name MODIFY COLUMN column\_name datatype;

#### Altering Table

The basic syntax of an ALTER TABLE command to add a NOT NULL constraint to a column in a table is as follows.

ALTER TABLE table\_name MODIFY column\_name datatype NOT NULL;

The basic syntax of ALTER TABLE to ADD UNIQUE CONSTRAINT to a table is as follows.

ALTER TABLE table\_name

ADD CONSTRAINT MyUniqueConstraint UNIQUE(column1, column2...);

The basic syntax of an ALTER TABLE command to ADD CHECK CONSTRAINT to a table is as follows.

ALTER TABLE table\_name

ADD CONSTRAINT MyUniqueConstraint CHECK (CONDITION);

The basic syntax of an ALTER TABLE command to ADD PRIMARY KEY constraint to a table is as follows.

ALTER TABLE table\_name

ADD CONSTRAINT MyPrimaryKey PRIMARY KEY (column1, column2...);

The basic syntax of an ALTER TABLE command to DROP CONSTRAINT from a table is as follows.

ALTER TABLE table\_name

DROP CONSTRAINT MyUniqueConstraint;

#### Altering Table

ALTER TABLE table\_name DROP INDEX MyUniqueConstraint; The basic syntax of an ALTER TABLE command to DROP PRIMARY KEY constraint from a table is as follows.

ALTER TABLE table\_name DROP CONSTRAINT MyPrimaryKey; If we are using MySQL, the code is as follows –

ALTER TABLE table\_name DROP PRIMARY KEY;

MySQL Order By clause is used to sort the table data in either Ascending order or Descending order. By default, data is not inserted into Tables in any order unless we have an index.

So, If we want to retrieve the data in any particular order, we have to sort it by using MySQL Order By statement.

Syntax:-SELECT Column\_Names

FROM Table\_Name

ORDER BY {Column1}[ASC | DESC] {Column2}[ASC | DESC]

#### MySQL Order by-e.g.

#### Suppose we are having student table with following data.

nysql> select * from student;								
	name		marks					
	freya mohak							
	¦ vishal ¦ vimal							
	anil		82					

Now we write the query – select \* from student order by class;

rollno	name	class	marks	
2	l mohak		99	
	l anil			
1	l freya	10	88	-2005 -
	l visĥal			
4	¦ vimal	10	82	

Query re<del>built win be in ascending order or class. We not speeny</del> query then ascending clause is applied by default

### MySQL Order by-e.g.

#### Suppose we are having student table with following data.

mysql> s	elect * from from from from from from from from	om studer	it;	
i rollno	i name	class	marks	
	freya mohak vishal vimal anil	10 10 10 2	82	
Now we write tr	le query – select	Trom studer	it order by a	class desc

	nysql> se	: 1	ect <del>×</del> fr	•••	n stude	t order by	class	desc;
	rollno		name		class	marks		
						88		
	: 3		visĥal		10	84 :		
Oue	: 4		vimal		10	82 :		
Que	: 5		anil		2	82 :		
	: 2		mohak		1	99 i		

## SQL

## MySQL Order by – e.g.

Suppose we are having student table with following data.

mysql> s	el	ect * fr	om stude	nt;	_	
rollno		name	class	marks		
23		mohak vishal	10 10 10 10 10 2	99 84		asc, marks

#### Now w

asc;

	•	lect * fro 		+	-+ -	class as	c,marks	asc;	
Query	- 5 - 4 - 3	mohak anil vimal vishal freya	1 2 10 10 10	99 82 82 82 84 84 88	-+			ame	e class
	then o	rdering	will	done	on	marks	colu	1	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1
۹ ا	Visit	: python.m	ykvs.in fo	or regula	r upda	ates			

## MySQL Order by-e.g.

Suppose we are having student table with following data.

mysql> select * from student;							
rollno	name	class	marks				
234	l vishal Vimal	10 10	84 82				
5	anil	2	82				

Now we write query-select \* from student order by class asc, marks desc;

An aggregate function performs a calculation on multiple values and returns a single value. For example, you can use the AVG() aggregate function that takes multiple numbers and returns the average value of the numbers.Following is the list of aggregate functions supported by mysql.

Name	Purpose	
SUM()	Returns the sum of given column.	
MIN()	Returns the minimum value in the given column.	
MAX()	Returns the maximum value in the given column.	
AVG()	Returns the Average value of the given column.	
COUNT()	Returns the total number of values/ records as per given column.	
	Visit : python.mykvs.in for regular updates	

## Aggregate Functions & NULL

Consider a table Emp having following records as-

Null values are excluded while (avg)aggregate function is used

	Emp	
Code	Name	Sal
E1	Mohak	NULL
E2	Anuj	4500
E3	Vijay	NULL
E4	Vishal	3500
E5	Anil	4000

#### **SQL** Queries

mysql> Select Sum(Sal) from EMP; mysql> Select Min(Sal) from EMP; mysql> Select Max(Sal) from EMP; mysql> Select Count(Sal) from EMP; mysql> Select Avg(Sal) from EMP; mysql> Select Count(\*) from EMP;

The GROUP BY clause groups a set of rows/records into a set of summary rows/records by values of columns or expressions. It returns one row for each group.

We often use the GROUP BY clause with aggregate functions such as SUM, AVG, MAX, MIN, and COUNT. The aggregate function that appears in the SELECT clause provides information about each group.

The GROUP BY clause is an optional clause of the SELECT statement.

Syntax –

SELECT 1, c2,..., cn, aggregate\_function(ci)

FROM table WHERE where conditions GROUP BY c1 , c2,...,cn;

Here c1,c2,ci,cn are column name

### MySQL group by – e.g.

#### Suppose we are having student table with following data.

mysql> select * from student;							
rollno	name	class	marks				
2 3 4	freya mohak vishal vimal	10 10 10	99 84 82				
: 5	¦ anil	: 2	: 82 :				

Now we write query-select class from student group by class;

mysql> select	class	from	student	group	by	class;	
++							
¦ class ¦							
++							
1 I I							de.
1 2 1							
10 I							
**							Æ

Query result will be unique occurrences of class values, just sin to use distinct clause like (select distinct class from student).

#### MySQL GROUP BY with aggregate functions

The aggregate functions allow us to perform the calculation of a set of rows and return a single value. The GROUP BY clause is often used with an aggregate function to perform calculation and return a single value for each subgroup.

For example, if we want to know the number of student in each class, you can use the COUNT function with the GROUP BY clause as follows: Suppose we are having student table with following data

mysql> select × from student;								
: rollno	name	class	marks					
2 3 4	freya mohak vishal vimal anil	10 10 10	84 82					

Now we write query-select class.count(\*) from student group by class:

+	+
¦ class	count(*)
+	++ 1
1 2	1
¦ 10	3

Query result will be unique occurrences of class values along with cousting students(records) of each class(sub group).

## MySQL GROUP BY with aggregate functions

we are having student table with following data.

mysql> se	lect * from	om stude	nt;
: rollno	i name	class	i marks i
234	freya mohak vishal vimal anil	10 10	99 : 84 :

Now we write query-select class,avg(marks) from student group by

class;

mysql> select class,avg(marks) from student group by class; +----+ | class | avg(marks) | +----+ | 1 | 99.0000 | | 2 | 82.0000 | | 10 | 84.6667 | +----+

Query result will be unique occurrences of class values along with average marks of each class(sub group).

MySQL GROUP BY with aggregate functions (with where and order by clause)

mysql> set	lect * fr	owing data om studer	nt;
i rollno	name	class	marks
+	freya	 10	88
: 2	: mohak	1 1	: 99
: 3	¦ vishal	: 10	84
: 4	: vimal	: 10	82
: 5	: anil	: 2	82

we

Now we write query—select class,avg(marks) from student where class<10 group by class order by marks desc;

Query result will be unique occurrences of class values where class<10 along with average marks of each class(sub group) and descending ofer of marks

The HAVING clause is used in the SELECT statement to specify filter conditions for a group of rows or aggregates. The HAVING clause is often used with the GROUP BY clause to filter groups based on a specified condition. To filter the groups returned by GROUP BY clause, we use a HAVING clause. WHERE is applied before GROUP BY, HAVING is applied after (and can filter on aggregates)

MySQL GROUP BY with aggregate functions & having clause we are having student table with following data.

nysql> select * from student;								
rollno	name	class	marks					
	freya							
	: mohak : vishal							
: 4	: vimal	10	82					
1 5	l anil	- 2	82					

Now we write query-select class, avg(marks) from student group by class having avg(marks)<90;

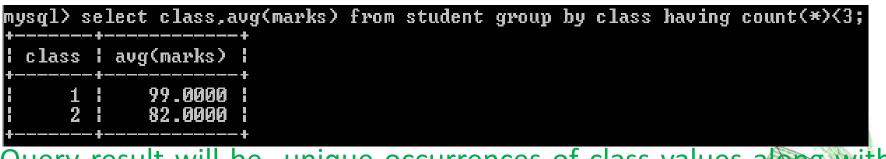

mysql> select class,avg(marks) from student group by class having avg(marks)<90; +-----+ | class | avg(marks) | +-----+ | 2 | 82.0000 | | 10 | 84.6667 | +-----+

Query result will be unique occurrences of class values along with average marks of each class(sub group) and each class having average marks<90.

MySQL GROUP BY with aggregate functions & having clause we are having student table with following data.

nysql> select * from student;							
: rollno	name	class	marks				
: 1	freya	10	88				
	: mohak		: 99 :				
: 3	: vishal	: 10	: 84 :				
: 4	¦ vimal	: 10	: 82 :				
1 5	¦ anil	: 2	: 82 :				

Now we write query-select class, avg(marks) from student group by class having count(\*)<3;

Query result will be unique occurrences of class values along with average marks of each class(sub group) and each class having less than 3 rows.

## Cartesian product (X)/cross joint

Cartesian Product is denoted by X symbol. Lets say we have two relations R1 and R2 then the cartesian product of these two relations (R1 X R2) would combine each tuple of first relation R1 with the each tuple of second relation R2.

SQL

Cartesian product (X) example Table a and Table b as shown below

mysql> sel	lect * f	rom a;
Name	val	
vishal ram		
2 rows in	set (Ø.	.00 sec)
mysql≻ sel	lect * f	rom b;
- - name 	-	
ram   vikrant +	-+	
2 rows in	set (Ø.	.00 sec)

### Mysql query –

Select \* from a,b;

Select \* from a cross join b;

mysql> se] +	lect * :	from a,b; +	Ŧ
Name	val	name +	-
¦ vishal	22 11		
4 rows in	set (Ø	.00 sec)	

Degree of cartesion product is 3 and cardinality is 4=(2 rows of a X 2 rows of b

SQL

Join – Join is used to fetch data from two or more tables, which is joined to appear as single set of data. It is used for combining column from two or more tables by using values common to both tables.

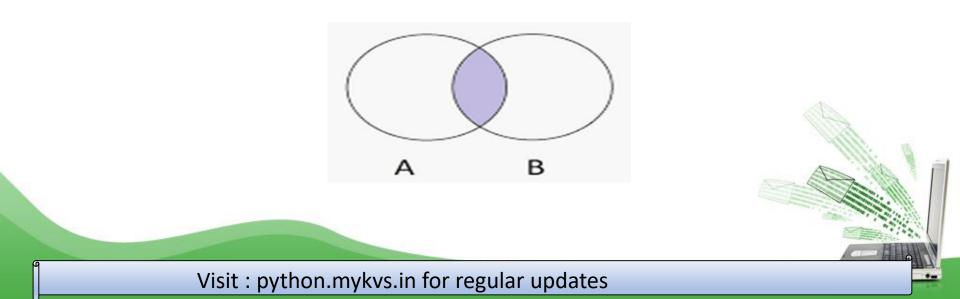

## Types of JOIN

Following are the types of JOIN that we can use in SQL:

- Inner
- Outer
- Left
- Right

## INNER Join or EQUI Join⋈

This is a simple JOIN in which the result is based on matched data as per the equality condition specified in the SQL query.

### INNER Join or EQUI Join example Table a and Table b as shown below

mysql> sel	lect *	from	a;	
Name	val	l		(
vishal ram	11 22			
2 rows in	set (	0.00	sec)	
mysql> se] +	lect * -+	from	b;	
name +	+ -+			nys( +
¦ ram ¦ vikrant +	-+			na +
2 rows in	set (	0.00	sec)	i Pé +

## Mysql query -

Select course.student\_name from couse , student where course.student\_name=student.stude nt\_name;

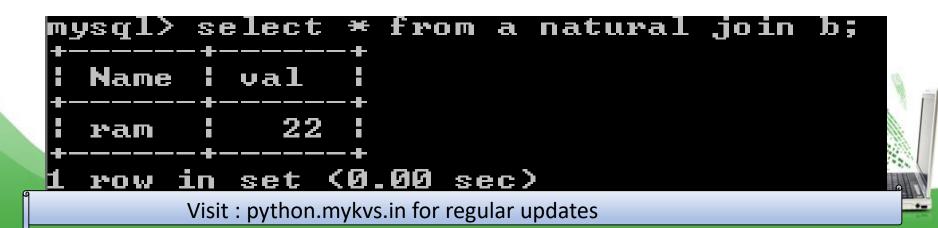

Select a.name from a inner join b where a.name=b.name;

nysql>	select	a.name	from	a	inner	join	b	where	a.name=b.name;	
+	-+									
l name	ł									
+	-+									
l ram	ł									
+	-+									

## Natural JOIN(⋈)

Natural Join is a type of Inner join which is based on column having same name and same datatype present in both the tables to be joined.E.g. Select \* from a natural join b;

## LEFT Outer Join D

The left outer join returns a resultset table with the matched data from the two tables and then the remaining rows of the left table and null from the right table's columns. E.g.

mysql> se]	lect × f	from a;
l Name	val	
vishal ram	11 22	
2 rows in	set (Ø.	.00 sec)
mysql> se] +	lect × f -+	from b;
name +	+ -+	
ram   vikrant		
2 rows in	set (Ø.	.00 sec)

#### Mysql query -

Select \* from a left outer join b on (a.name=b.name);

Name	l val	l name			
vishal ram					

#### **RIGHT Outer Join**

 $\bowtie$ 

The right outer join returns a resultset table with the matched data from the two tables being joined, then the remaining rows of the right table and null for the remaining left table's columns.E.g.

mysql> +	select	* from a; +	
Name	va		
visha   ram	al		
2 rows	in set	<0.00 sec	>
mysql> +	select	* from b;	
l name	+		
¦ ram ¦ vikra	ant		
2 rows	in set	<0.00 sec	>

#### Mysql query –

Select \* from a right outer join b on (a.name=b.name);

nysql> select \* from a right outer join b on (a.name=b.name); +----+ | Name | val | name | +----++ | ram | 22 | ram | | NULL | NULL | vikrant | +----++ 2 rows in set (0.00 sec)

## SQL

#### **Full Outer Join**

#### $\mathbb{M}$

The full outer join returns a resultset table with the matched data of two table then remaining rows of both left table and then the right table.E.g.

mysql> select * from a;		
Name	val	
vishal ram	11 22	
2 rows in	set (0.	00 sec>
mysql> sel	lect * f	rom b;
name	1	
ram   vikrant		
2 rows in	set (0.	.00 sec>

#### Mysql query -

Select \* from a left outer join b on (a.name=b.name) union Select \* from a right outer join b on (a.name=b.name) ;
